

CPU market share 2021 to 2030

PC and server CPUs | Five historical years and five projected years

BofA projects Arm-based processors to lead server CPU value share by 2030 at 47.3%, versus AMD at 30.7% and Intel at 22.0%. Intel remains the largest PC CPU supplier in the illustrative 2030 extension, at 52.7%. [S1, pp. 6 and 21; X1]

Scope: worldwide PC and server CPU silicon, shown separately. The main measure is annual value share, including x86 and Arm-based designs. History covers 2021–2025; projections cover 2026–2030, including the current year. Prepared 23 September 2026. Unit share is shown on page 3.

Source: BofA / Vivek Arya et al., 12 Aug 2026, pp. 6 and 21. Solid lines are historical estimates; dashed lines are broker forecasts. Dotted PC lines for 2029–2030 are the illustrative extension X1, calculated 23 Sep 2026. All figures are percentages.

Read value share with care

Arm-based covers multiple suppliers and custom chips; it is not Arm Holdings revenue. Value shares include imputed custom-silicon values. BofA revised Arm's 2025 server value share from 11.0% in February to 32.3% in August, while its 2025 unit share changed only from 13.6% to 13.7%. This is a restatement for the same year, not adoption between report dates. [S4, p. 17; S1, pp. 5 and 19]

Annual CPU value share

Each row measures the same annual CPU market within its segment. H = historical estimate; F = BofA forecast; X = illustrative extension. Values may total 99.9% or 100.1% because of source rounding.

Server CPUs

Calendar year	Intel	AMD	Arm-based	Status
2021	86.6%	12.9%	0.5%	H
2022	75.7%	23.4%	0.9%	H
2023	67.8%	28.6%	3.6%	H
2024	60.5%	31.6%	7.9%	H
2025	40.4%	27.4%	32.3%	H
2026	33.9%	27.7%	38.4%	F
2027	26.6%	27.8%	45.6%	F
2028	24.3%	30.6%	45.1%	F
2029	23.2%	31.0%	45.8%	F
2030	22.0%	30.7%	47.3%	F

S1: BofA / Arya et al., 12 Aug 2026, p. 21 for 2021–2028 and p. 6 for 2029–2030. Arm combines merchant and custom processors; value includes estimates for captive silicon.

PC CPUs

Calendar year	Intel	AMD	Arm-based	Status
2021	79.1%	15.5%	5.4%	H
2022	74.7%	16.6%	8.7%	H
2023	74.2%	15.9%	9.9%	H
2024	72.2%	18.2%	9.7%	H
2025	64.5%	23.2%	12.3%	H
2026	60.3%	25.6%	14.1%	F
2027	58.5%	25.8%	15.8%	F
2028	57.4%	25.8%	16.8%	F
2029	55.0%	26.7%	18.3%	X
2030	52.7%	27.5%	19.8%	X

S1: BofA / Arya et al., 12 Aug 2026, p. 21 through 2028. X1: 2029–2030 are illustrative extensions of the 2025–2028 average annual share changes, without independent empirical validation. They are not BofA forecasts; see page 4.

Unit share and forecast comparisons

Shipment share measures CPU units, rather than the assigned value of those units. It is also different from installed-base share, CPU core share and complete-server-system share. An Arm architecture share should not be compared directly with an AMD share restricted to x86.

Annual unit share in the BofA model

Segment	Calendar year	Intel	AMD	Arm-based
Server	2023	75.5%	19.6%	4.9%
Server	2024	70.0%	22.6%	7.3%
Server	2025	62.0%	24.2%	13.7%
Server	2026E	53.2%	27.4%	19.4%
PC	2023	71.8%	17.1%	11.1%
PC	2024	69.2%	20.2%	10.6%
PC	2025	65.4%	20.9%	13.7%
PC	2026E	59.0%	25.7%	15.3%

S1: BofA / Arya et al., 12 Aug 2026, pp. 16 and 19; Mercury Research, company reports and BofA estimates. 2023–2025 are historical estimates; 2026E is a full-year forecast. The value table uses p. 21; see the PC source discrepancy on page 5.

Latest quarterly checkpoint

Second quarter 2026	Intel	AMD	Arm-based
Server units	53.9%	28.4%	17.6%
PC units	59.1%	25.6%	15.3%

S1: Mercury Research as reproduced by BofA / Arya et al., 12 Aug 2026, pp. 16 and 19. Quarterly readings are separate from annual estimates.

Server CPU unit share in 2030

Forecast vintage	Intel	AMD	Arm-based
BofA 12 Aug 2026	35.7%	30.4%	33.9%
UBS 21 May 2026	29.0%	29.0%	42.0%

BofA's unit shares above are calculated from 29.3 million Intel, 24.9 million AMD and 27.8 million Arm-based CPUs, totaling 82.0 million. For Arm: $27.8 \div 82.0 \times 100 = 33.9\%$. UBS publishes the shares directly. [S1, p. 5; S2, p. 2]

This is a comparison of two research models, not consensus. Their starting market sizes differ: BofA has 29.9 million server CPUs in 2025; UBS has 23 million. Their 2030 Arm unit-share difference should therefore be treated as a model and scope debate. [S1, p. 5; S2, p. 2]

PC extension and sensitivity

X1 extends BofA's PC value-share table by two years. It carries forward the average annual percentage-point gains for AMD and Arm from 2025 to 2028, then calculates Intel as the remainder. This is a mechanical scenario, not a separate demand, pricing or product forecast.

Worked calculation for 2030

AMD annual gain = $(25.8\% - 23.2\%) \div 3 = 0.8667$ percentage points. Arm annual gain = $(16.8\% - 12.3\%) \div 3 = 1.5000$ percentage points. The inputs are BofA's 2025 historical estimates and 2028 forecasts. [S1, p. 21]

AMD 2030 = $25.8\% + 2 \times 0.8667 = 27.5\%$. Arm 2030 = $16.8\% + 2 \times 1.5000 = 19.8\%$. Intel 2030 = $100\% - 27.5333\% - 19.8\% = 52.7\%$. Calculations retain precision until display. [X1, 23 Sep 2026]

2030 PC value share under different assumptions

Post 2028 share gains	Intel	AMD	Arm-based
0× annual gains	57.4%	25.8%	16.8%
1× annual gains used	52.7%	27.5%	19.8%
1.5× annual gains	50.3%	28.4%	21.3%

X1, calculated 23 Sep 2026 from S1 p. 21. The multipliers are illustrative assumptions, not probabilities or confidence bounds. Holding the other series constant, a 0.5-point change in either annual gain changes its 2030 share by 1 point and Intel's share by the opposite amount.

What is sourced and what is assumed

Input tag	Meaning in this document
HARD	Exact source values: the historical estimates and published broker forecasts. Sourced does not mean certain.
PARTIAL	Derived quantities: annual share-gain rates and BofA 2030 unit shares, calculated from published rounded inputs.
ESTIMATE	The assumption that the PC share-gain rates persist after 2028 and the sensitivity multipliers.

Validation limits

Arithmetic checks pass: every share is between 0% and 100%; all displayed source rows sum to 100% within 0.1 point; the extension sums to 100% before rounding. All market-share comparisons use annual flows or explicitly labeled quarterly flows.

The PC extension is anchored to a historical estimate and a future broker estimate. It has no independent empirical validation or backtest. The 2030 figures are directional. Independent source audit: PASS on transcription and arithmetic; PARTIAL on the model because future outcomes and the PC extension are not externally validated.

Sources and interpretation

Primary research used

Pages 16 and 19, Exhibits 17 and 26: PC and server shipment shares. Page 20, Exhibit 29: Mercury Research unit outlook. Page 21, Exhibit 30: annual PC and server value-share history and forecasts.

S2 UBS — Quantifying the server CPU opportunity. Sunny Lin, Randy Abrams and Nicolas Gaudois; 21 May 2026; pp. 1–2, Figure 2. Used as a separately attributed server unit-share comparison.

S4 BofA Global Research — CPU in AI key inference beneficiary TAM could more than double by CY30. Vivek Arya et al.; 23 February 2026; p. 17. Used only to illustrate revisions to historical estimates, not as the forecast baseline.

S3 Mercury Research product methodology. Accessed 23 September 2026. Describes shipment, pricing, revenue and segment-share coverage. No numerical market shares in this document are taken from that webpage.

X1. Calculated on 23 September 2026 from S1 p. 21. The 2029–2030 PC extension and sensitivity cases are explicitly illustrative; they are not an approved Capstone house forecast.

Source differences that affect interpretation

Historical value shares can change with the model. BofA's February report estimated Arm's 2025 server value share at 11.0%; its August report uses 32.3%. The corresponding unit shares are much closer, at 13.6% and 13.7%. The change between reports is a revision to the estimate for the same year, not a new shipment event. [S4, p. 17; S1, pp. 19 and 21]

Within the August report, PC 2025 value shares differ between the annual summary on p. 21 (Intel 64.5%, AMD 23.2%, Arm 12.3%) and p. 16 (64.8%, 23.3%, 11.9%). The main tables and PC extension consistently use p. 21. The unit table separately reproduces the p. 16 shipment series. [S1]

Custom silicon value is imputed. BofA states modeling assumptions of roughly 75% of AMD's average price for custom Arm and 1.25 times for merchant Arm. These are not uniform realized ratios across the table: aggregate merchant Arm also reflects separate NVIDIA pricing and mix. Value share is therefore sensitive to those conventions. The Arm-based category includes licensees and custom designs, rather than just Arm Holdings. [S1, p. 5]

The main paths retain one BofA forecast vintage. UBS is shown separately. Market-share changes alone do not establish revenue growth, returns or a stock recommendation; the report compares CPU silicon shares and excludes GPUs, smartphones and embedded processors.
